

V1.0 - modbus RTU Arduino Opta

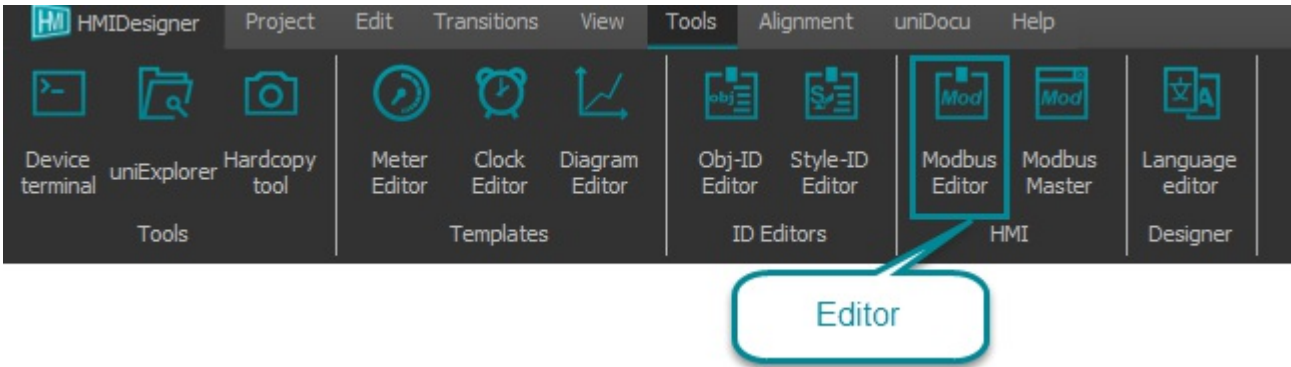

Version	V1.0
Status	Under development
Created	18-Februar 2025 10:38
Last modified	21-Februar 2025 11:10
Modified by	ladmin

Hardware

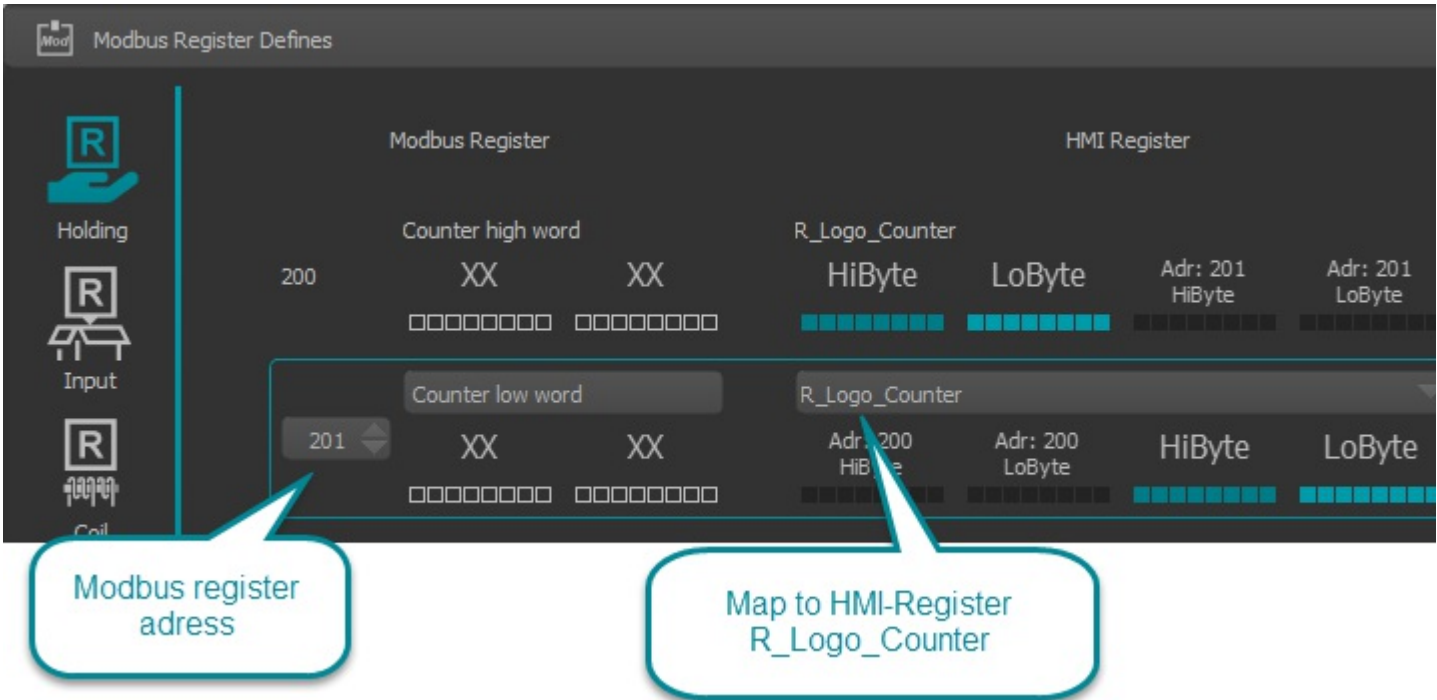

Software

The EA HMI display visualizes data send from the Arduino OPTA.  
 To exchange data through modbus, values need to map to registers:

Inside the Modbus Editor Registers can be build and be assigned.

Data ussage:  
 The data, from the Arduino OPTA, is display directly on the HMI display

Modbus connection

Modbus connection monitoring:  
 The system checks in certain intervals whether data has ben received via Modbus.

Software Arduino Opta

Arduino IDE 2.3.4.  
 Please see Arduino IDE for more details.  
 Used devices:  
 Arduino OPTA (finder)

## Arduino\_Opta

---

EA HMI043WM-42ATCS display

Included librarys to Arduino IDE:

ArduinoModbus, by Arduino

ArduinoRS485, by Arduino

The display is setup as modbus slave (server)

The Arduino OPTA is setup as modbus Master (Client)

Interface setup EA HMI-Module:

Baudrate = 115200

Modbus adress = 42

The Arduino OPTA reads a digital input and analog input and sends data to display. It also sets an output, depending on user input through HMI-Module.

The display shows data and checks connection to Arduino.
